Even though this is a subject thats been debated by a few for a certain time, many of the folks that read articles that talk about it are not conscious of how to integrate email and billing using UML diagram.<http://www.f2dassociates.com/userfiles/compaq-ipaq-h3600-pocket-pc-manual.xml>

Before you can properly incorporate charging and email, you have to comprehend different kinds of billing as well as how to handle the different procedures that are available on the market. For instance, you might discover that it would be a lot easier to have your billing invoices sent from a service which automatically claims the user or a billing solution that has a mail option that enables automatic invoice processing. The principal part of integrating email and billing using UML diagram is knowing what methods of payments are out there. Some of the most frequent payment methods include credit cards, EFT electronic fund transfer, PayPal, checks, online bank transfers, and merchant banking transactions. These are the chief methods of payment utilized and having one of these methods as the chief method is going to save you a lot of headache in the future. So how can you understand which of those methods to utilize. This will ask that you begin by developing a new diagram which highlights all of the different techniques. You may choose to make a new UML view and then go through it line by line to try and figure out what the true functionality will be. In general, its easier to concentrate on the qualities of each method rather than making assumptions about how theyll be used in the future. Having a customer base lets you take advantage of the several procedures of payment that are available. After youve created a design of these different methods, it is time to proceed to incorporate your billing functions. So once you send out a statement, this will probably be transformed into the corresponding type of payment, and the facts of the payment will be entered on the invoice. When you have mapped out all of the features for each payment method, you can start adding on your software to allow the user to make their decision based on a charge card type. What you need to realize is that the consumer will always want a credit card type as a payment method.

This is the default process. Its also important to guarantee that the software permits the user to select between PayPal and online bank transfers. Using a tool which permits the user to create a choice on how they would love to cover their bill is something that could definitely save you money and time in the long term. The easiest way to begin integrating email and charging with UML diagram would be to design a basic module and then have the end user select which payment type theyd like to utilize. Some people may prefer to use one type of payment method, while some may prefer to pay with another method. Using a high level of sophistication allows you to make the user feel comfortable while they make their pick.
