Letting your car run low on transmission fluid can cause the transmission to shift improperly or even not at all. It also can harm the internal parts of your transmission, which will not be properly lubricated. Unfortunately, you may not hear any noises or have other clues that your transmission is low on fluid, until it's too late. Checking the transmission fluid level requires working under the hood of your car with the engine running. This can be very dangerous if you aren't careful. You should therefore contact your garage mechanic in order to have it checked. They will have equipment for checking oil levels and topping it up if necessary. If, however, you still wish to carry out this operation yourself, here is our advice. Refer to your service manual to find out what transmission fluid your gearbox requires and how frequently it should be changed. The manual will also tell you where the filling cap is located. This is where the transmission is located on most cars with rearwheel drive. On cars with frontwheel drive, the transmission dipstick is usually located in the front of the engine, connected to the transaxle. Disengage the clutch and apply the handbrake. If your car has been used for more than 30 minutes, allow the engine to rest for a few minutes so that the transmission fluid can cool down. This is important for your safety, as well as ensuring that the results are not biased. Given that there is no gauge, you may use a metal stem or screwdriver in order to probe the oil level and find out how high it is in the sump. If this happens, then it is at the right level. Quickly replace the cap. However, we recommend that you get a professional to carry this out. Remember to screw the filling cap back on in accordance with the instructions in the user manual. You may order presentation ready copies to distribute to your colleagues, customers, or clients, by visiting <http://mistlondon.com/userfiles/eos-1d-iii-manual.xml> If your transmission fluid is leaking, it can cause damage to your engine.

Manual transmissions consist of internal gears, bearings, and synchronizers that allow the driver to shift gears. Many manual transmissions are lubricated with a heavy petroleum-based oil. When this oil breaks down, its lubricating properties break down, which can make it harder for the driver to get the transmission into gear. Place the wheel chocks around the rear tires. Using the hydraulic floor jack, lift the front of the vehicle one side at a time at the manufacturer's suggested jacking points. Lift it just high enough for you to gain clearance underneath. Place the jack stands under the manufacturer's lifting points and lower the vehicle onto the jack stands. Most of the time, the filler plug is a large bolt located about halfway up the side of the transmission. Using the ratchet and the socket that fits snug on the filler plug, remove the filler plug. Check the fluid level per the

manufacturers specifications from a repair manual. If you don't, then the fluid is low. If there is fluid at that level, then no additional fluid is needed. Using the fluid pump, add fluid into the transmission through the filler plug. Reinstall the filler plug and tighten it to manufacturer's specifications. Using the floor jack, lift the vehicle one side at a time and remove the jack stand. Then lower the vehicle to the ground. However, if you are not familiar with the type of system your vehicle has or if you are not comfortable replacing the transmission fluid yourself, then you should consult the assistance of a certified mechanic, like one from YourMechanic. If you're in doubt about how frequently to check your transmission fluid, you can look up your car to find out more about when your car needs to be serviced. Your SL2 always will be a nicely built vehicle but even the most wellprotected cars will require mechanical service and repair. The quality manufacture and high value that come with a Saturn SL2 are good reasons for usually buying performance and aftermarket systems of at least that quality; highquality parts dont always have to break the bank. When your car breaks down, the best answer is a new high performance OEM or replacement auto part to keep your Saturn in likenew shape. Often the most frustrating job about doing work on your vehicle is looking for a reliable source of quality parts. Reliable OEM parts are what mechanics need to keep that Saturn in running order however tough the conditions.

Though Saturn is the newest division of General Motors GM, some of the car's defects have been around other GM models for a long time. CAS has received complaints on common Saturn defects such as engine problems, transmission breakdowns, water leaks, and other body defects. GM tried to do everything

right with the Saturn but missed several major marks. Even Saturns with air bags still have this motorized passive belt system which induces 70% of occupants to forget to use the separate lap belt. The 1991-92 Saturns both had failing passenger crash test scores. Not until Saturn came out with a standard dual airbags in 1995 did it pass all the crash tests. An example of problem avoidance came in Saturn's largest recall of 352,883 1991-93 models for underhood fires caused by a short circuit in the generator which led to excess current and overheating in the wiring harness as well as generator failure. Rather than replace the defective and more expensive generators, Saturn opted to change the wiring from the generator to tolerate the higher current from the short circuit leaving the owner to pay for any generator that failed.

Service bulletins issued by Saturn document dozens of problems, including engine, transaxle, and other components. Manual transaxles may pop out of fifth gear, and automatics have a harsh or erratic upshift. On SC models, using the horn can cause the headlights to pop up. The engine can miss, surge, backfire, lack power on acceleration, or stall after startup. Saturn notified about 1,800 owners of 1991 models that their engines had incorrect coolant supplied by Texaco and that they would get new cars. Engine problems continue to plague Saturn with 1991-97 models needing new cylinder heads due to coolant mixing with the oil.
